### Schweitzer's Wide Open Spaces Lure Eastern Skiers

By Kent L. Pietsch  
Member West Point Ski Team

Ski slopes throughout the East have assumed many aspects of the metropolitan traffic snarl. Millions of dollars in artificial snow machines, expensive ski chalets, giant parking facilities, and miles of life lines have not solved the basic problem any more than landscaped parkways and modern turnpikes have alleviated the traffic jams. In the East, there is

nothing but open snowfields above the treeline, the true dream of skiers everywhere.

Nature avoided the ski dilemma of the East when she created beautiful Schweitzer Basin in northern Idaho. The acreage above the treeline provides almost unlimited area into which any skier may turn his tips. Newly carved access trails to the bottom of the lift line lend variety and depth to the basin.

The energetic trail racer will find ample areas in which he can slalom the pines and snow-berry bushes while the sedate Sunday skier may cautiously pick his way down the wide

devoid of those freeway for common to so many ski developments. Speaking as one who has had the opportunity to visit some of the more popular slopes and trails in the East, I can only say Schweitzer will amaze you in the busy days of this Christmas!

### Ski Skill, First Aid for Employee

All employees in Schweitzer Basin will be taught to ski a will be trained in first aid. Manager Sam Wormington promises. In addition, a volunteer unit of the ski patrol will

the weather to travel on. Both came into being where in central Asia at 5,000-6,000 years ago. The knowledge of early and snowshoes does not give which was developed but in their primitive form the snowshoe and the ski about the same shape and about the same purpose. It is probable that the snowshoe was probably made of a branch bent into a cle, tied with thongs, and laced with other branches. The early ski was made of a plank-shaped or pieces of wood about the shape as the circular snowshoe and was likewise attached to the feet with thongs. The ski took its own development, while

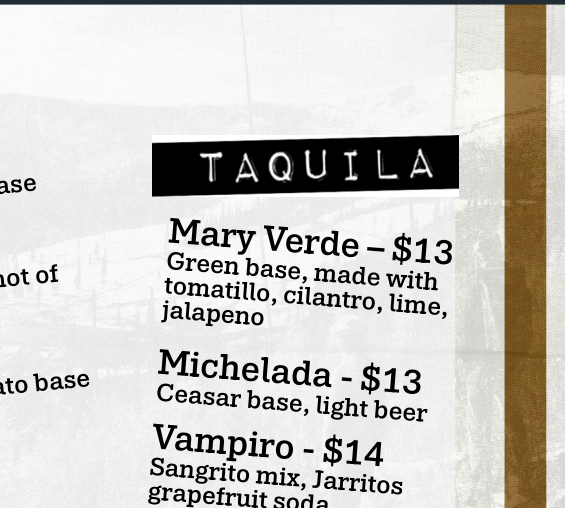

the southern type developed in the Arctic ski is that it was often covered with animal fur. The southern type is a more recent development in Scandinavia, Eastern Europe, and the West into the modern ski. It is now being used on increasing numbers of hills, and its use is increasing. The modern ski is a type of ski that is now being used on increasing numbers of hills, and its use is increasing.
